

## COOLPLAS TREATMENT PROCESS

---

**1:** Before beginning treatment, your area of concern will be marked to ensure proper placement and size of the applicator.

**2:** An antifreeze membrane (cool gel pad) is placed over the area to protect your skin from the applicator.

**3:** This specially designed cooling applicator uses vacuum pressure to draw tissue into the cooling panels.

## COOLPLAS TREATMENT PROCESS

---

**4:** A few minutes after application, you will feel some pressure and coolness. This disappears after approximately 8 minutes.

**5:** The applicator delivers precisely controlled cooling that freezes your targeted fat cells. These fat cells are safely, gradually, and naturally eliminated from your body.

**6:** The treatment is comfortable, non-invasive, and there are no restrictions afterwards. This is a great time to relax or catch up on some good reading. Since we have two Coolplas machines, your treatment can occur in half the amount of time of most other centers!

## COOLPLAS TREATMENT PROCESS

---

**7:** After the one hour treatment, your skin will be red and raised. This is only temporary after the applicator is removed.

**8:** The treated area is massaged for a few minutes, and the skin goes down and returns to normal. Massage is a safe and effective way to further reduce the fat layer following a Coolplas treatment.
